

Adding actions

ToolJet supports several actions that can be invoked as the handler for any `event` that is triggered in an application.

To add actions

To attach an action for component events, click on the component's handle, and then click on the `Add handler` button on the inspector panel available on the right side.

To attach an action for query events, select the query, go to the `advanced` tab and then click on the `Add handler` button.

Available actions

Some of the actions that ToolJet Support are

Action	Description
Show alert	Show an alert message as a bootstrap toast
Run query	Run any of the data queries that you have created
Open webpage	Go to another webpage in a new tab
